

AMBICASTELLATED SCREEDED FLOOR CONSTRUCTION

ambiente®

more than underfloor

PRODUCT OVERVIEW

The castellated panels can be supplied 'plain' or with an EPS backing - as useful way of incorporating the insulation layer and pipe fixing method into one product. The panel is a moulded plastic panel, with an overall depth of 20mm - the 'castles' are spaced at 50mm intervals provide a consistent fixing point and enabling a fast and neat pipework installation.

The castellated system has two further benefits over a traditional clip system:

- The plastic panels act as a separating layer, meaning that additional DPM layer is not necessary
- The castles protect the pipework prior to screeding - especially important if screeding is a while after initial installation (of course we always recommend that screeding takes place ASAP after installation)
